This table gives the area,  $p$ , under a normal distribution curve, described by a mean value,  $\mu$ , and a standard deviation,  $\sigma$ , that lies to the right of a value  $x$ . The area is found by calculating the deviation,  $z$ , using the equation

$$z = (x - \mu)/\sigma$$

For example, the proportion of the area under a normal distribution curve that lies to the right of a deviation of 0.04 is 0.4840, or 48.40%. The area to the left of the deviation is given as  $1 - p$ . Thus, 51.60% of the area under the normal distribution curve lies to the left of a deviation of 0.04. When the deviation is negative, the values in the table give the proportion of the area under the normal distribution curve that lies to the left of  $\mu$ . Therefore, 48.40% of the area lies to the left, and 51.60% of the area lies to the right of a deviation of -0.04.
